Houston, Texas

# Functional Data

- **Functional Data**:
  - Ideal units of observation: curves
  - Observed data: curves sampled on fine grid
- Increasingly encountered in biomedical research with new technologies taking automated measurements
- Present unique challenges:
  - Extremely large data sets (>100s-1000s per curve)
  - Curves may be complex and irregular, spatially heterogeneous with many local features

Example: Accelerometer Data

- **Accelerometers:** small motion sensors that digitally record minute-by-minute activity levels
  - Increasingly used in surveillance and intervention studies

- **TriTrac-R3D:** sensor worn on hip
  - Minute-by-minute record of motion in 3 planes
  - Condensed into single activity level measurement/minute
  - Activity "profile" for each day

Accelerometer Data

http://biostatistics.mdanderson.
org/Morris
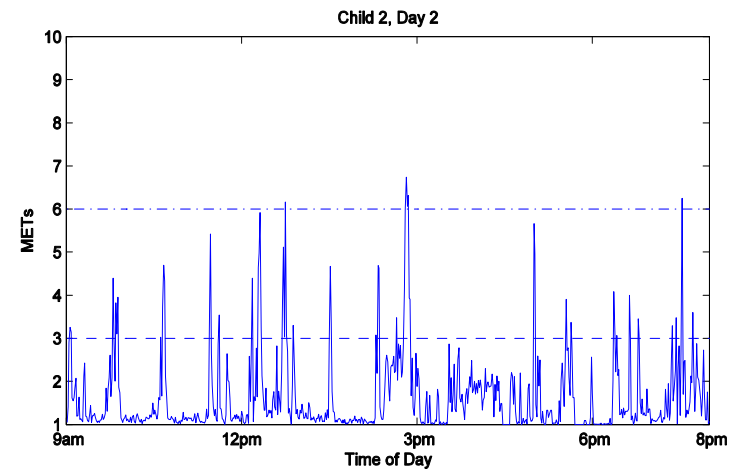

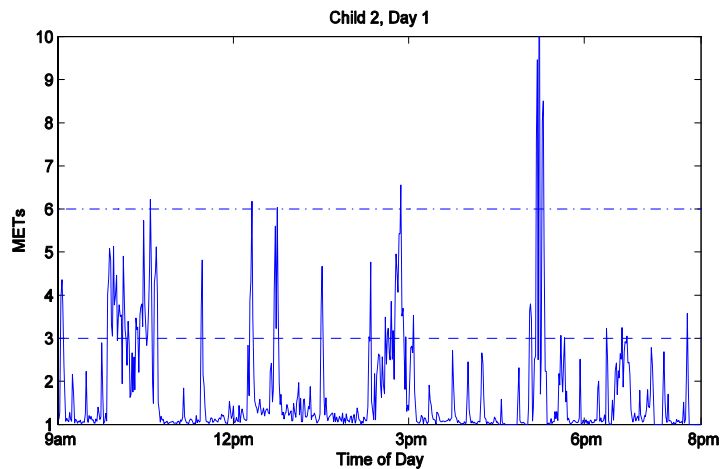

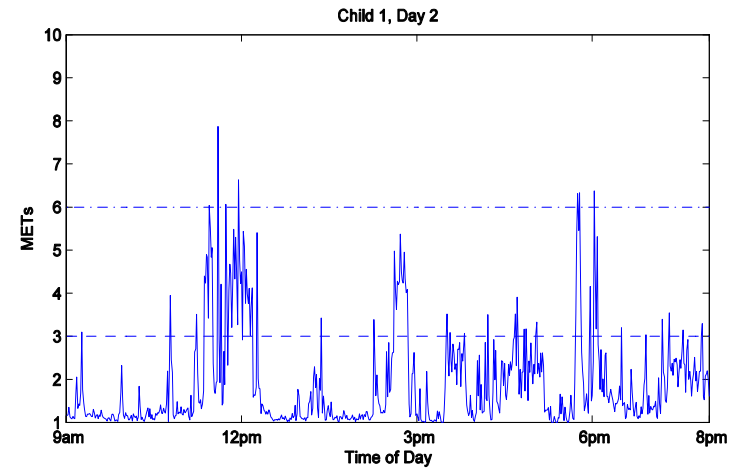

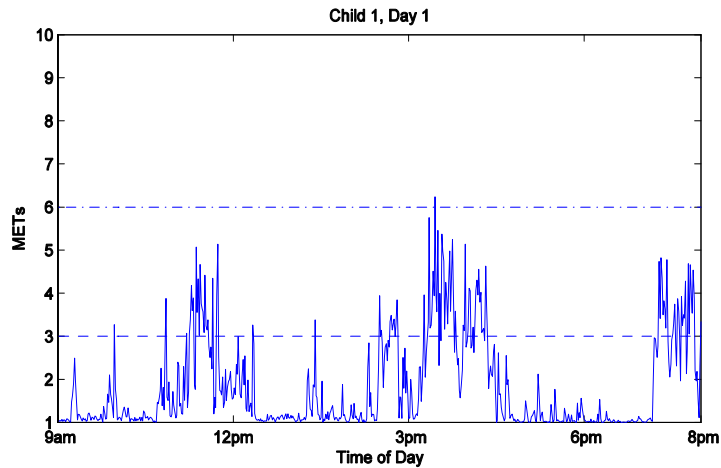

Accelerometer Data

- **Planet Health Study** (Harvard University):
  - Intervention study investigating activity levels of middle school children in Boston area schools
  - Children's activity levels objectively monitored using TriTrac-R3D activity monitor for one or two 4-day sessions
  - Data considered: 292 daily profiles/103 children/5 schools *660 measurements/profile* (every minute from 9am-8pm)

- **Goals:**
  1. Assess how activity levels vary throughout day, across schools, across different days of the week, over time from early to late Spring, and across various child-level covariates.
  2. Assess relative variability in activity levels from day-to-day and child-to-child, in order to guide future study design.

Linear Mixed Models

Linear Mixed Model (Laird and Ware, 1982):

$$\underbrace{Y}_{N\times 1} = \underbrace{X}_{N\times p} \overbrace{\beta}^{p\times 1} + \underbrace{Z}_{N\times m} \overbrace{u}^{m\times 1} + \underbrace{e}_{N\times 1}$$

$$u \sim N(0, \overbrace{D}^{m\times m})$$
$$e \sim N(0, \underbrace{R}_{N\times N})$$

- **Fixed effects** part, $X\beta$, accommodate a broad class of mean structures, including main effects, interactions, and linear coefficients.
- **Random effects** part, Zu, provide a convenient mechanism for modeling correlation among the N observations.

Functional Mixed Model

Suppose we observe a sample of *N* curves, $Y_i(t)$, $i=1, \ldots, N$, all defined on $\mathcal{T}$

$$U_k(t) \sim GP(0, Q)$$
$$E_i(t) \sim GP(0, S)$$

$$Y_i(t) = \sum_{j=1}^{p} X_{ij} B_j(t) + \sum_{k=1}^{m} Z_{ik} U_k(t) + E_i(t)$$

- $B_j(t)$ = **fixed effect functions**
- $U_k(t)$ = **random effect functions**
- $E_i(t)$ = **residual error processes**
- Q **and** S **are covariance surfaces on** $\mathcal{T} \times \mathcal{T}$
  - $S(t_1, t_2) = \text{Cov}\{E_i(t_1), E_i(t_2)\}$: **describes within-curve covariance structure of residual curve-to-curve deviations**

Functional Mixed Models

- **Key feature of FMM**: Does not require specification of parametric form for curves

- **Kernels/fixed-knot splines may not work well for spatially heterogeneous data – inherent smoothness assumptions attenuate local features**

- **Wavelet Regression: nonparametric regression technique that better preserves local features present in the curves.**
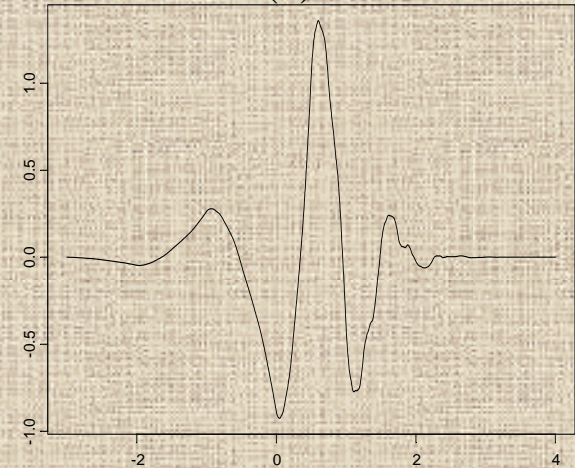

Introduction to Wavelets

- **Wavelets:** families of orthonormal basis functions

$$g(t) = \sum_{j,k \in \mathfrak{I}} d_{jk} \psi_{jk}(t)$$

$$\psi_{jk}(t) = 2^{-j/2} \psi(2^{-j/2} t - k)$$

$$d_{jk} = \int g(t) \psi_{jk}(t) dt$$

Daubechies (4) Basis Function

- **Discrete Wavelet Transform (DWT): fast algorithm $\{O(T)\}$ for obtaining T empirical wavelet coefficients for curves sampled on equally-spaced grid of length T.**

- **Linear Representation:** $d = \mathbf{y}\ W'$
  - $W' = T$-by-T orthogonal projection matrix

- **Inverse DWT (IDWT):** $y = d\ W$

Wavelet Regression

- **Wavelet Regression** – 3 step process
    1. Project data into wavelet space
    2. Threshold/shrink coefficients
    3. Project back to data space
- Yields *adaptively regularized* (plot) nonparametric estimates of function
- Morris, et al. (2003) extended to hierarchical functional model (Bayesian)
- Morris and Carroll (2006) extended to general functional mixed model framework (wavelet-based functional mixed model)

Functional Mixed Model
(Discrete version)

Y = *N*-by-*T* **matrix containing the observed spectra on sampling grid of size** *T*

$$\underbrace{Y}_{N \times T} = \overbrace{X}^{N \times p} \underbrace{B}_{p \times T} + \overbrace{Z}^{N \times m} \underbrace{U}_{m \times T} + \underbrace{E}_{N \times T}$$

$$U_i \sim MVN(0, Q)$$
$$E_i \sim MVN(0, S)$$

- B_{ij} **is the effect of covariate** *i* **at location** t_j
- *Q* **and** *S* **are covariance matrices** (*T* x *T*)
- **Note: Some structure must be assumed on form of Q and S (discussed later)**

Wavelet-Based FMM:
General Approach

1. **Project** observed functions Υ **into wavelet space.**

2. **Fit FMM** **in wavelet space.**

    (Use MCMC to get posterior samples)

3. **Project** **wavelet-space estimates (posterior samples)** **back to data space**.

Wavelet-Based FMM:

General Approach

1. **Project** observed functions Y **into wavelet space.**

2. **Fit FMM** in wavelet space (Use MCMC to get posterior samples)

3. **Project** wavelet-space estimates (posterior samples) **back to data space**.

Wavelet-Based FMM

1. **Project** observed functions Y **to wavelet space**

- **Apply DWT to rows of Y to get wavelet coefficients corresponding to each observed function**

$$\underbrace{D}_{N \times T} = \underbrace{Y}_{N \times T} \underbrace{W'}_{T \times T}$$

- **Projects the observed curves into the space spanned by the wavelet bases.**

Wavelet-Based FMM:
General Approach

1. **Project** observed functions Y **into wavelet space.**

2. **Fit FMM** in wavelet space
    (Use MCMC to get posterior samples)

3. **Project** wavelet-space estimates (posterior samples) **back to data space**.

Projecting FMM to Wavelet Space

$$\underbrace{Y}_{N \times T} = X \overbrace{B}^{N \times p} + \overbrace{Z}^{N \times m} \underbrace{U}_{m \times T} + \underbrace{E}_{N \times T}$$

where $\underbrace{}_{p \times T}$ under B.

$$U_i \sim MVN(0, Q)$$

$$E_i \sim MVN(0, S)$$

Projecting FMM to Wavelet Space

$$\underset{N \times T}{Y} \overset{T \times T}{\mathbf{W'}} = \overset{N \times p}{X} \underset{p \times T}{B} + \overset{N \times m}{Z} \underset{m \times T}{U} + \underset{N \times T}{E}$$

$$U_i \sim MVN(0, Q)$$

$$E_i \sim MVN(0, S)$$

Projecting FMM to Wavelet Space

$$\underbrace{Y}_{N \times T} \overbrace{\mathbf{W}'}^{T \times T} = \overbrace{X}^{N \times p} \underbrace{B}_{p \times T} \overbrace{\mathbf{W}'}^{T \times T} + \overbrace{Z}^{N \times m} \underbrace{U}_{m \times T} \overbrace{\mathbf{W}'}^{T \times T} + \underbrace{E}_{N \times T} \overbrace{\mathbf{W}'}^{T \times T}$$

$$U_i \sim MVN(0, Q)$$

$$E_i \sim MVN(0, S)$$

Projecting FMM to Wavelet Space

$$\underbrace{Y}_{N \times \mathrm{T}} \overbrace{\mathbf{W'}}^{\mathbf{T \times T}} = \overbrace{X}^{N \times p} \underbrace{B}_{p \times \mathrm{T}} \overbrace{\mathbf{W'}}^{T \times T} + \overbrace{Z}^{N \times m} \underbrace{U}_{m \times \mathrm{T}} \overbrace{\mathbf{W'}}^{T \times T} + \underbrace{E}_{N \times \mathrm{T}} \overbrace{\mathbf{W'}}^{T \times T}$$

$$U_i \mathbf{W'} \sim MVN(0, \mathbf{W}Q\mathbf{W'})$$

$$E_i \mathbf{W'} \sim MVN(0, \mathbf{W}S\mathbf{W'})$$

Projecting FMM to Wavelet Space

$$\underbrace{\mathbf{D}}_{N \times \mathrm{T}} = \overbrace{X}^{N \times p} \underbrace{\mathbf{B}^*}_{p \times \mathrm{T}} + \overbrace{Z}^{N \times m} \underbrace{\mathbf{U}^*}_{m \times \mathrm{T}} + \underbrace{\mathbf{E}^*}_{N \times \mathrm{T}}$$

$$\mathbf{U}_i^* \sim MVN(0, \mathbf{Q}^*)$$

$$\mathbf{E}_i^* \sim MVN(0, \mathbf{S}^*)$$

Prior Assumptions

Mixture prior on $\beta_{ijk}{}^{*}$:

$$\beta^{*}_{ijk} = \gamma^{*}_{ijk} N(0, \tau_{ij}) + (1 - \gamma^{*}_{ijk})\delta_0$$

$$\gamma^{*}_{ijk} = \text{Bernoulli}(\pi_{ij})$$

- **Nonlinearly shrinks $\beta_{ijk}{}^{*}$ towards 0, leading to adaptively regularized estimates of $\beta_i(t)$.**
- **τ_{ij} & π_{ij} are regularization parameters**
  - **Can be estimated from the data using empirical Bayes**
  - **Extend Clyde&George (1999) to functional mixed model**

Model Fitting

- **MCMC** to obtain posterior samples of model quantities
  – Work with marginal likelihood; U* integrated out;
- Let Ω be a vector containing ALL covariance parameters (i.e. $Q*$ and $S*$).

MCMC Steps

1. **Sample from $f(B*/D,\Omega)$:**
   Mixture of normals and point masses at 0 for each i,j,k.

2. **Sample from $f(\Omega/D,B*)$:**
   Metropolis-Hastings steps for each j,k

3. **If desired, sample from $f(U*/D,B*,\Omega)$:**
   Multivariate normals

Wavelet-Based FMM:
<u>General Approach</u>

1. **Project** observed functions Y **into wavelet space.**

2. **Fit FMM** in wavelet space (Use MCMC to get posterior samples)

3. **Project** wavelet-space estimates (posterior samples) **back to data space.**

Wavelet-Based FMM

3. **Project** wavelet-space estimates (posterior samples) **back to data space.**

- **Apply IDWT to posterior samples of B^* to get posterior samples of fixed effect functions $B_j(t)$ for $i=1,\ldots, p,$ on grid t.**

  – **B=B*W**

- **Posterior samples of $U_k(t)$, Q, and S are also available, if desired.**

- **Can be used for Bayesian inference/prediction**

Model

Let *Y* be 292×660 matrix containing *292* accelerometer profiles for each minute from 9am-8pm.

$$Y = XB + ZU + E$$

- **X = 292 × 14 matrix of covariates**
  - **School effects (5), gender, triceps calipers, BMI, day-of-week (4), daylight savings time, avg tv hrs/wk**
- **B = 14 × 660 matrix of fixed effects functions**
  - B_{ij} **is effect of covariate *i* at time t_j**
- **Z = 292 × 106 matrix indicating child for each profile**
  U = 106 × 660 matrix of random effect functions (1/child)
- **E = 292 × 660 matrix of residual errors**

Selected Results: School Effects
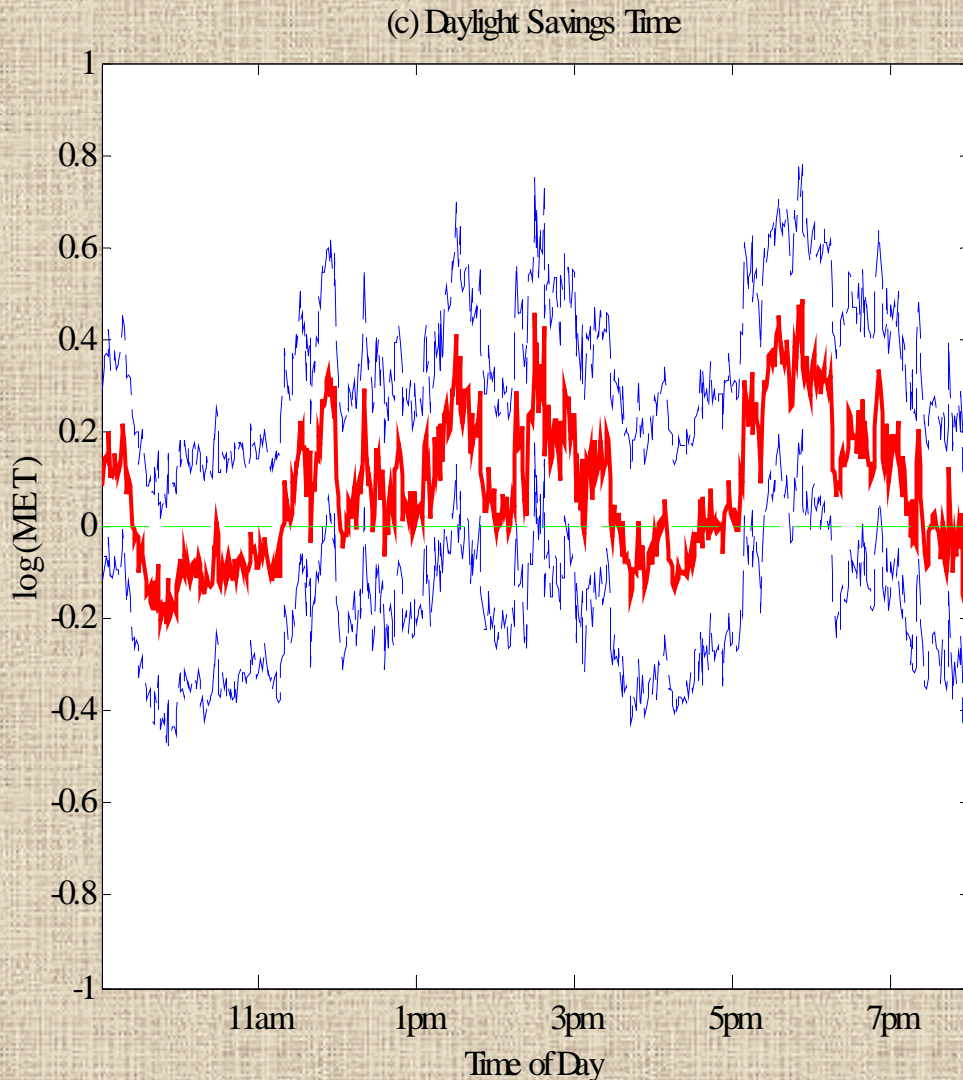

(a) School E
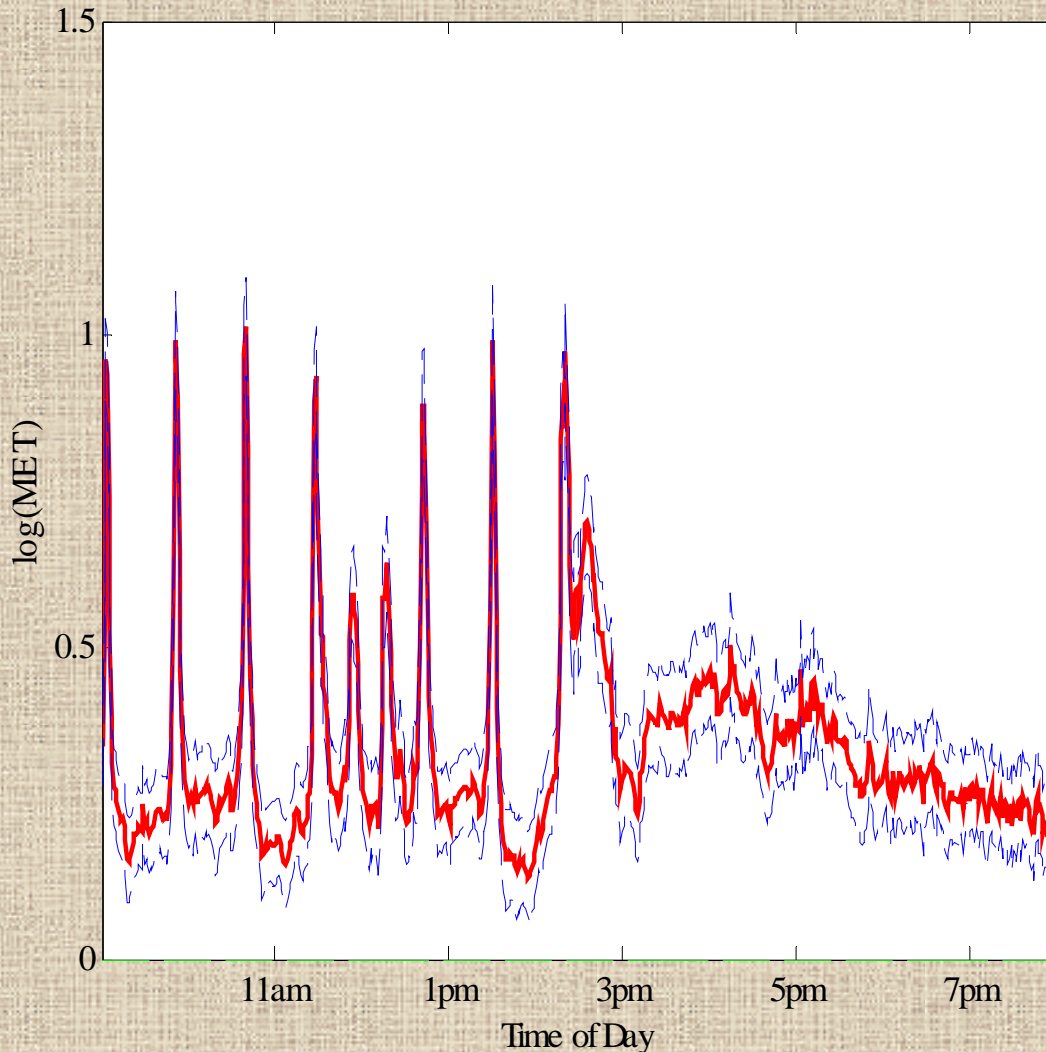

- **School schedules evident in effects**
  - **Spikes every 48min (changing classes)**
  - **3 lunch periods**
 - **School out at 2:15pm**
- **Not so evident in individual curves**

Selected Results: **DST Effect**

(c) Daylight Savings Time

- **DST – April 6th**
- **More active after DST** (overall 8%, *p=0.062*)
- **Especially strong:**
  - **As school is letting out (2:15-3:00, 25%, *p=0.03*)**
  - **In early evening (5:30-7:00, 30%, *p=0.01*)**
- **Note: Sunset was**
  - **5:10-6:15 before DST**
  - **7:15-8:10 after DST**

Selected Results: TV hours/wk

(d) Average Hours of TV per Week

- **TVhrs coded as continuous factor (standardized)**
- **TVhrs effect negative (-1.3% per sd, *p=0.03*)**
  - **More TV, less active**
  - **3:00-5:30, -2.6%, *p=0.02***
  - **7:00-8:00, -3.6%, *p=0.008***
- **Positive effect over lunch**
  - **+2.7%, *p=0.03***
  - **More TV, on average more active over lunch**

Results: Covariance Analysis

- **Variability: 91% day-to-day, 9% child-to-child**
  - **Important to have many days per child**
- **Study variability as function of *t***
  - **Child-to-child** **variability:** **school day** **>** **after school**
  - **Day-to-day** **variability:** **after school** **>** **school day**
  - **Relative day-to-day variability after school: 95%-99%**
- **Equivalent designs:**
  - **108** **children, 4 days/child**
  - **72** **children, 8 days/child**
  - **54** **children, 16 days/child**
- **Less children, more days, save $$$?**

Discussion

- **Introduced unified modeling approach for FDA**
  - **Can accommodate very irregular functions**
- **Method based on mixed models; is FLEXIBLE**
  - **Accommodates a wide range of experimental designs**
  - **Addresses large number of research questions**
- **Posterior samples allow Bayesian inference and prediction**
  - **Posterior credible intervals; pointwise or joint**
  - **Predictive distributions for future sampled curves**
  - **Predictive probabilities for classification of new curves**
  - **Bayesian functional inference can be done via Bayes Factors**
- **Since a unified modeling approach is used, all sources of variability in the model propagated throughout inference.**

Discussion

- **Approach is Bayesian. The only informative priors to elicit are regularization parameters, which can be estimated from data using empirical Bayes.**

- **Developed general-use code – reasonably fast and straightforward to use → minimum information to specify is Y, X, Z matrices.**

- **Can deal with missing data, i.e. partially observed functions (not discussed here)**

- **Method generalizes to higher dimensional functions, e.g. image data, space/time (fixed domain) data.**

Accelerometer Example

Let $Y_{ij}(t)$ be accelerometer profile on day j from child i

$$Y_{ij}(t) = B_0(t) + \sum_{k=1}^{p_1} X_{ik} B_k^{child}(t) + \sum_{k=1}^{p_2} X_{ijk} B_k^{day}(t) + U_i(t) + E_{ij}(t)$$

- X_{ik} = **child-level covariates (school, race, gender, BMI, % body fat, avg hrs of TV/week)**

  X_{ijk} =**day-level covariates (day-of-week, DST)**

- $B_0(t)$ = **overall mean** profile

  $B_k^{child}(t)$ = **effect functions** for child-level covariates

  $B_k^{day}(t)$ = **effect functions** for day-level covariates

- $U_i(t)$ = **Random effect function for child i**

Results: Bouts

Probability of Bout, Fuller Middle School, Thursday

- **Can compute posterior predictive probabilities of bouts for children**

Results: Bouts

Probability of Bout, Fuller Middle School, Thursday

- **Can compute posterior predictive probabilities of bouts for children**
- **Model-based predictive probabilites not far from empirically-estimated probabilities**
- **May want heavier tails**

Some Results

(a) School E

(b) BMI

(c) Daylight Savings Time

(d) Average Hours of TV per Week

- **School #5:**
  - **Spikes every 48min (changing classes)**
  - **3 lunch periods**
  - **School out at 2:15pm**
- **BMI effect positive**
  - **Artifact of preprocessing?**
- **Daylight Savings Time**
  - **More active after DST**
  - **Especially 2-3pm, 5-7pm**
- **Avg hrs TV/week**
  - **More TV=less active**
  - **Especially 3-5pm, 7-8pm**
  - **More active at lunch**

Results

Overall Mean Function

Adaptive Regularization

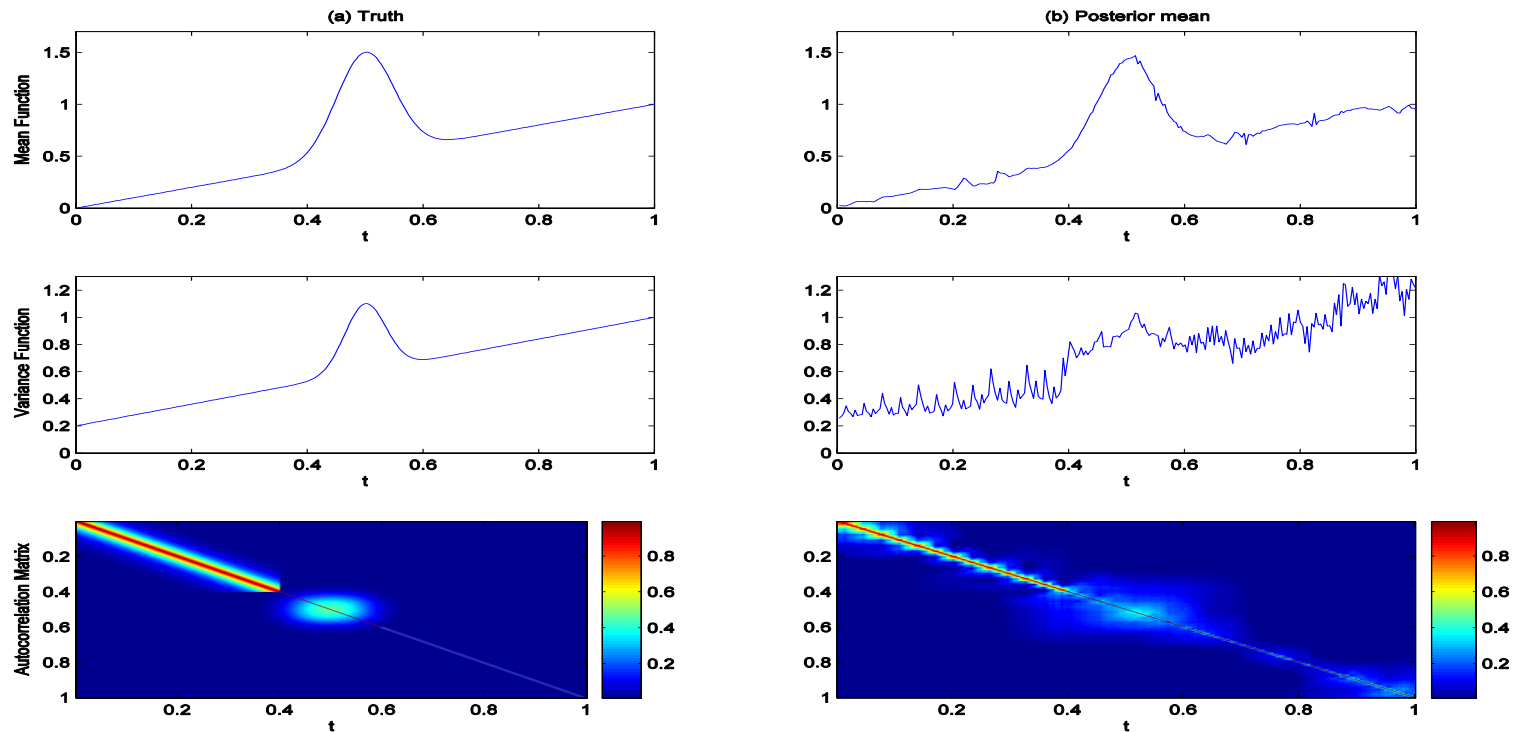

http://biostatistics.mdanderson.
org/Morris

Simulation: Covariance Structure

(a) Truth

- **True mean**: line plus peak
- **True variance:** increasing in t, with extra var at peak
- **True autocorrelation:** Strong autocorrelation (0.9) at left, weak autocorrelation (0.1) right, extra at peak

Simulation: Covariance Structure

- **Independence in wavelet space** accommodates varying degrees of **autocorrelation in data space**
- **Allowing variance components to vary across scale j and location k accommodates nonstationarities**
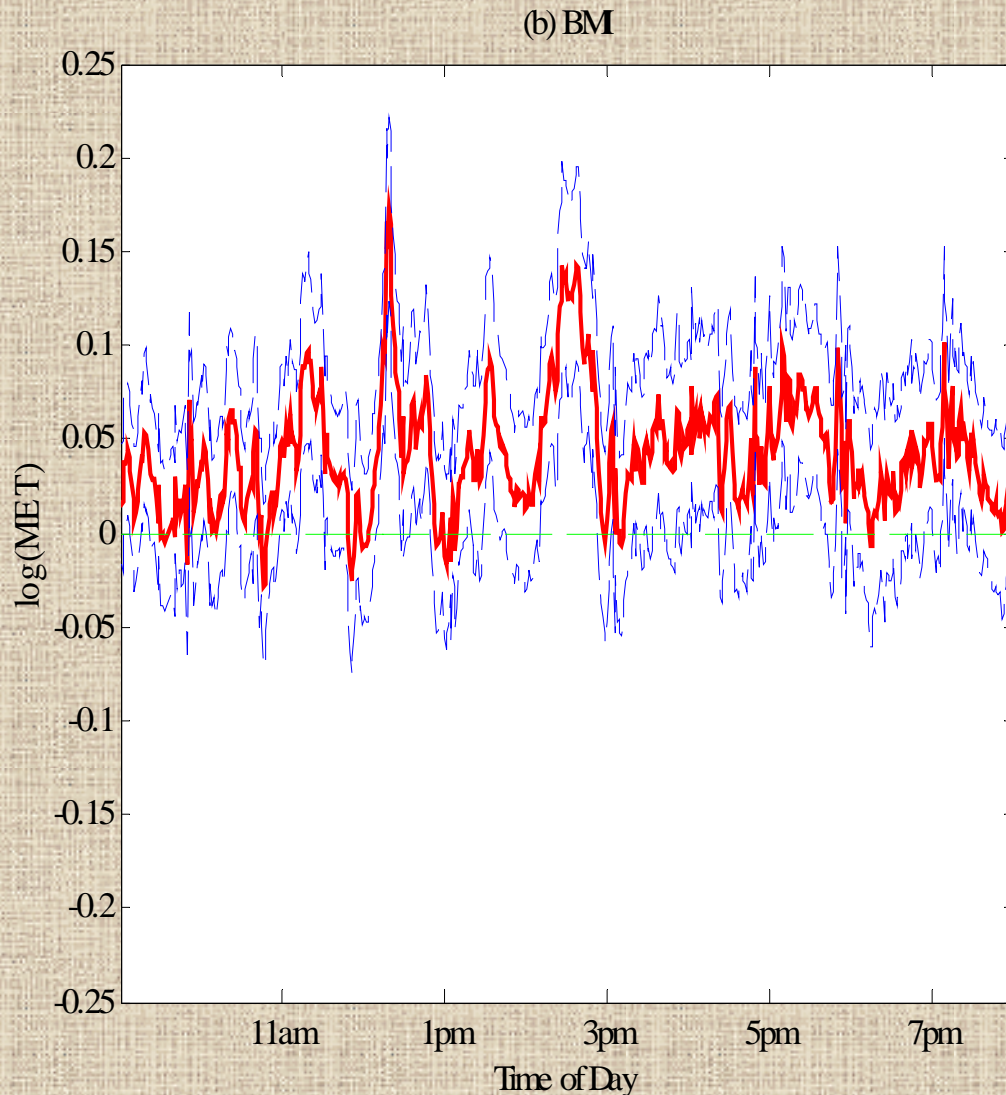

Model Each Column Separately

$$\underbrace{d_{jk}}_{N \times 1} = \overbrace{X}^{N \times p} \underbrace{\beta^{*}_{jk}}_{p \times 1} + \overbrace{Z}^{N \times m} \underbrace{u^{*}_{jk}}_{m \times 1} + \underbrace{e^{*}_{jk}}_{N \times 1}$$

$$u^{*}_{jk} \sim N(0, q^{*}_{jk})$$

$$e^{*}_{jk} \sim N(0, s^{*}_{jk})$$
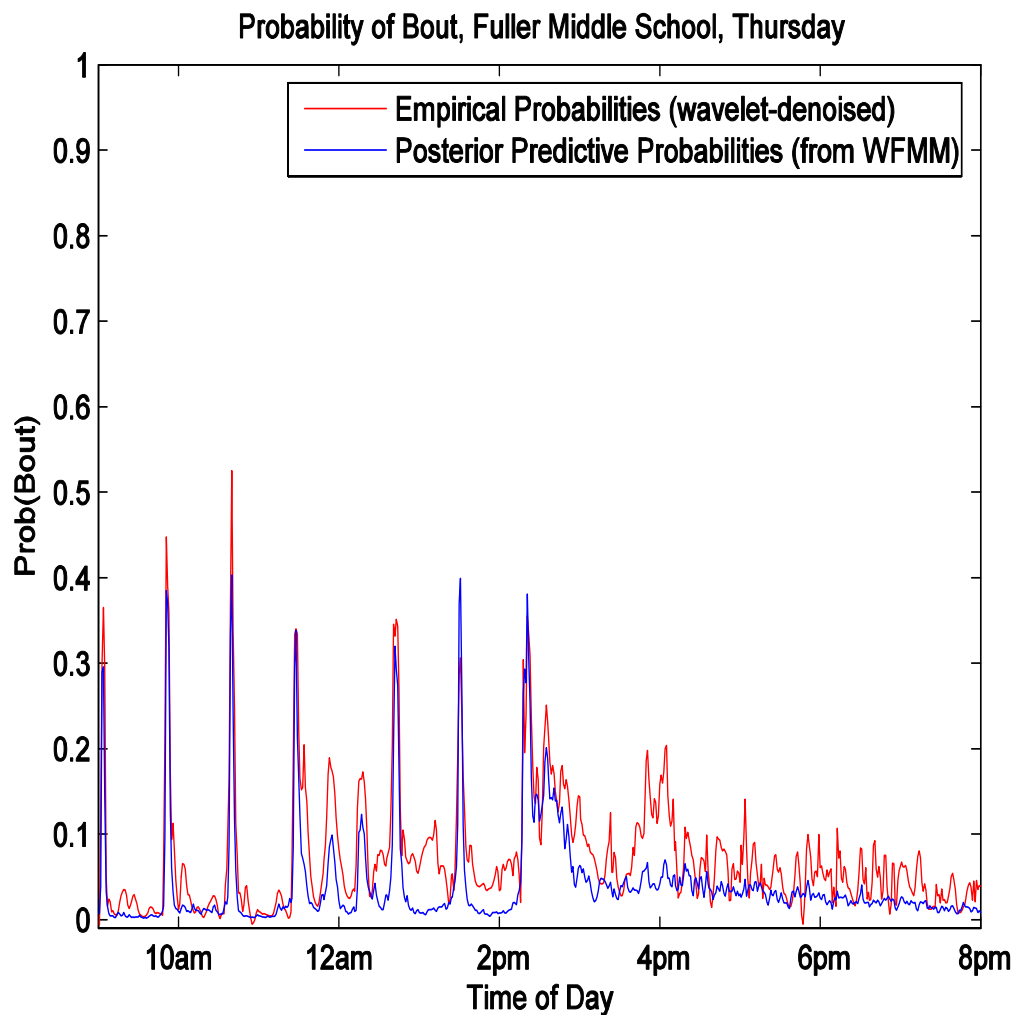

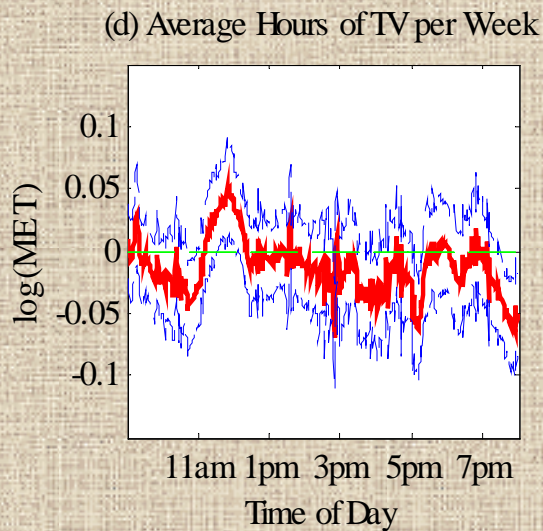

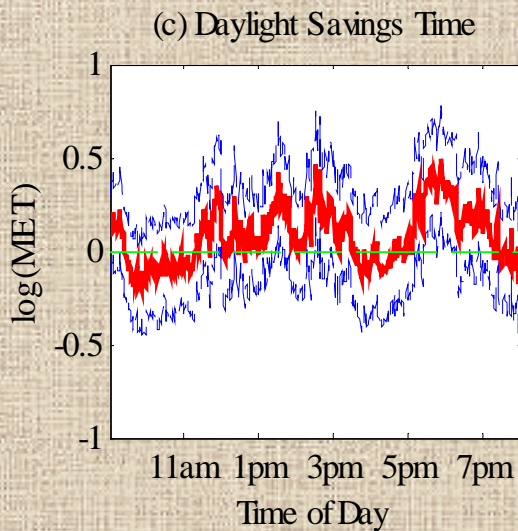

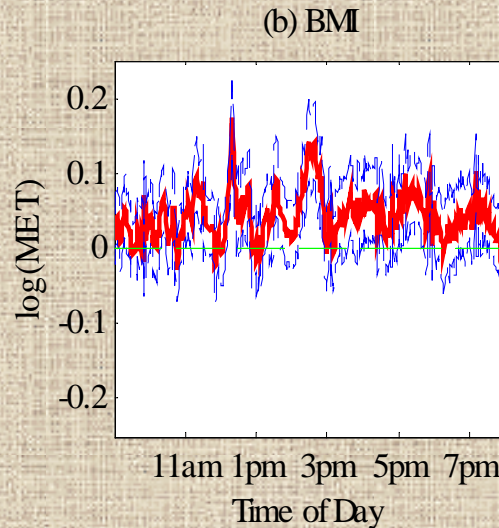

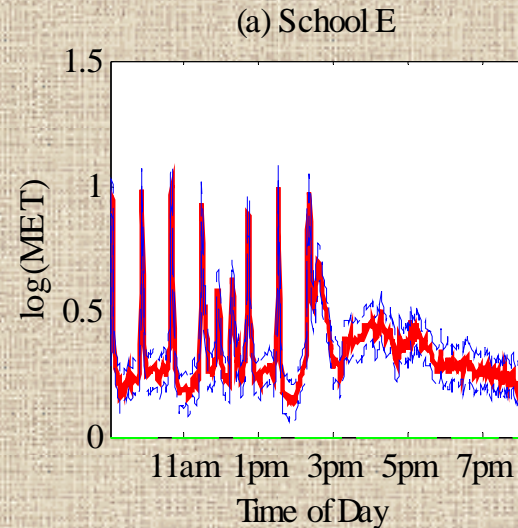

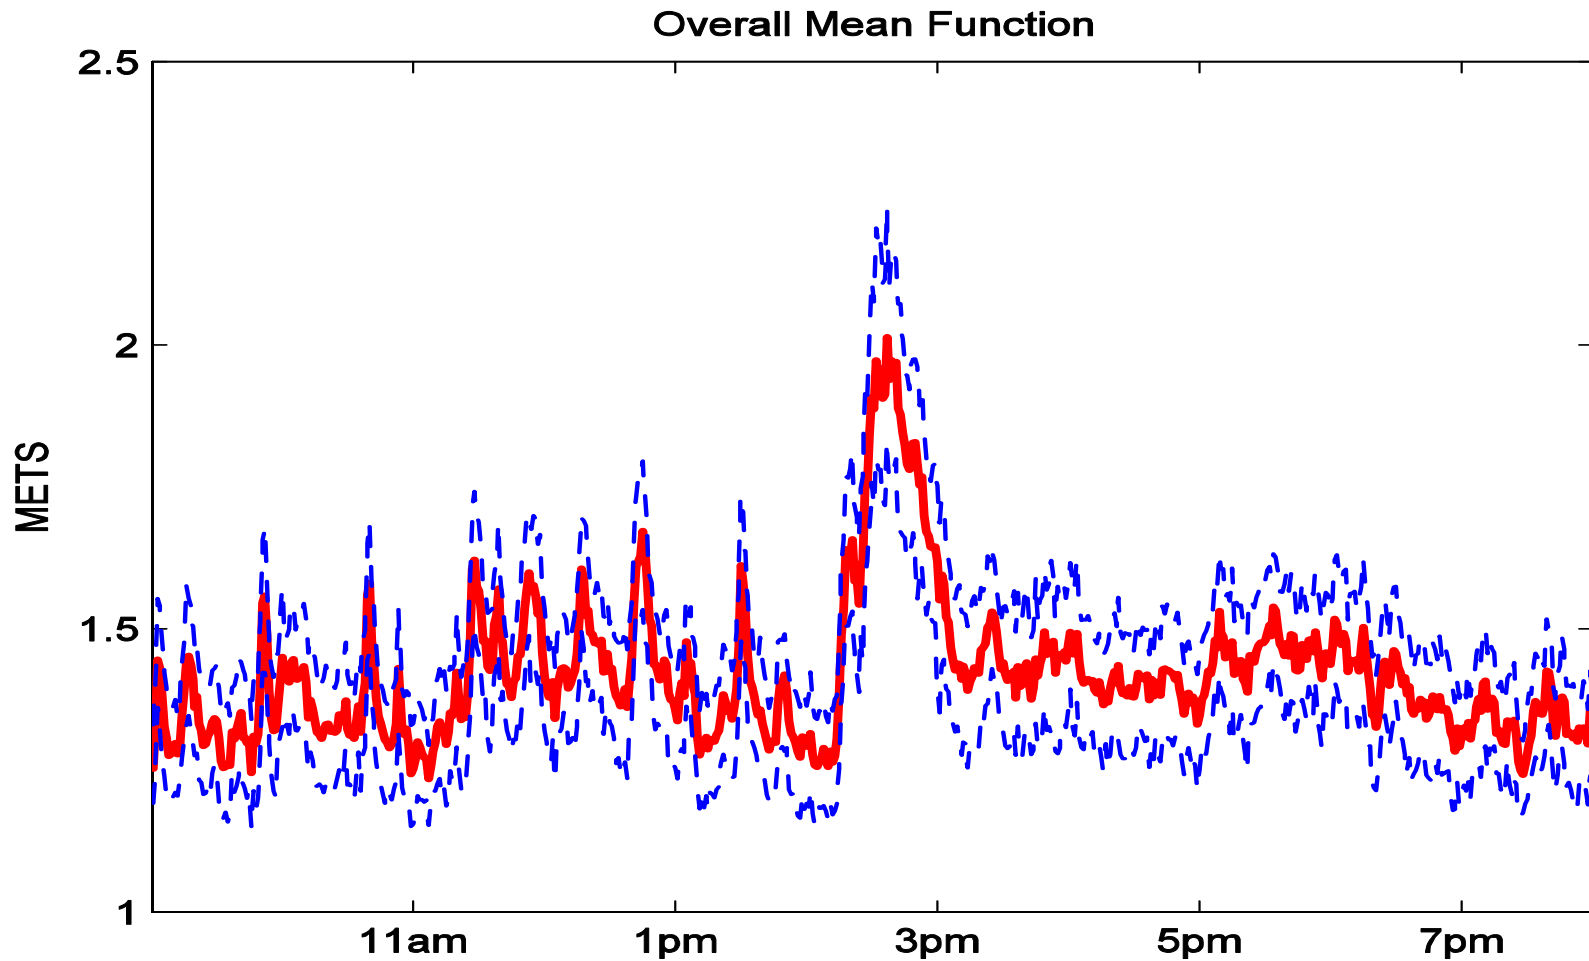

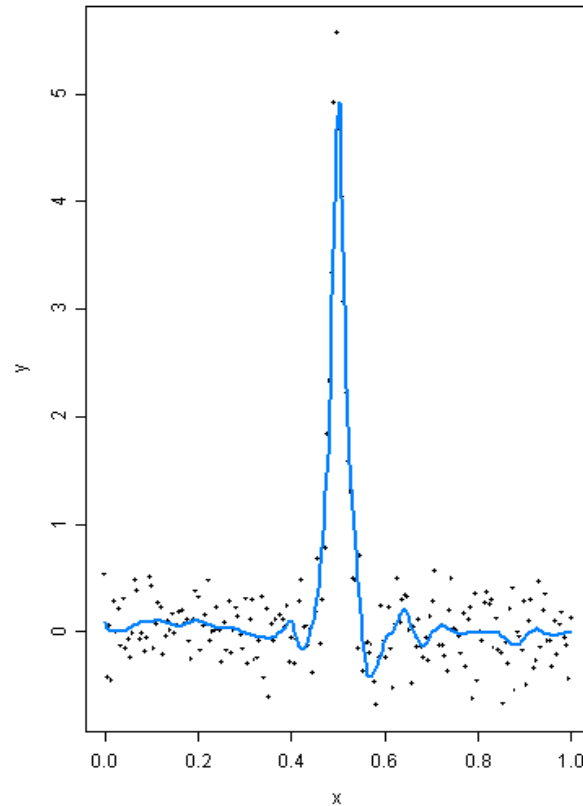

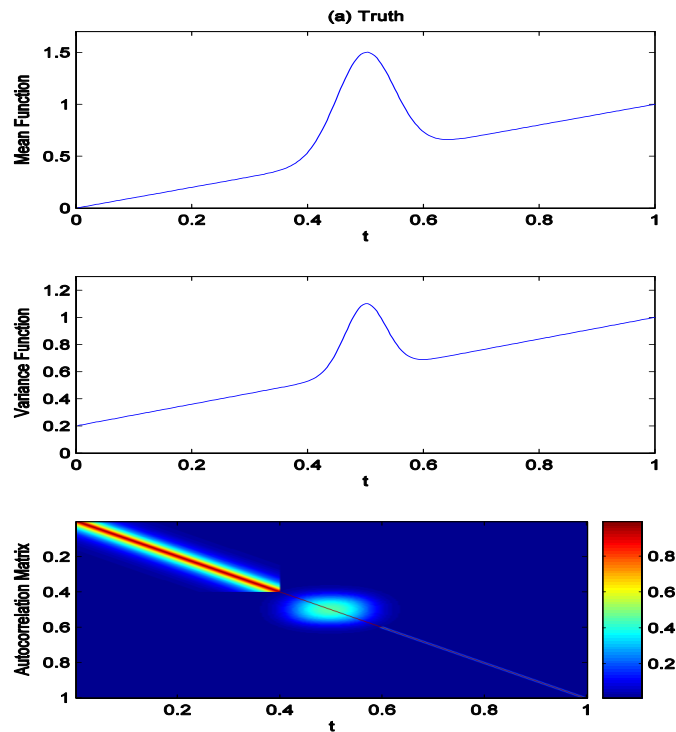

Selected Results: BMI Effect

(b) BM

- **BMI Coded as continuous factor (mean-centered)**
- **BMI effect positive ($p<0.0005$)**
  - **Higher BMI, more active**
  - **Preprocessing artifact?**
- **Should raw activity levels be monitored instead of METs?**
